INTRODUCTION

This report presents the requirement analysis phase for the project entitled “Design and Implementation of an Adaptive E-learning Platform based on Quality of Experience for Inclusive Online Education in Low-resource Settings.”

The purpose of this phase is to analyse the data gathered from stakeholders during Task 2, identify user needs, classify system requirements, prioritize important features, develop a Software Requirement Specification (SRS) for the proposed system, validate the requirements with stakeholders and identify the type of application we are going to build.

Data collected through surveys, observations, brainstorming, and reverse engineering techniques were analysed to determine the functional and non-functional requirements of the platform.

OVERVIEW OF TASK 2 RESULTS

Task 3 focused on gathering requirements for the proposed adaptive e-learning platform based on Quality of Experience (QoE) for inclusive online education in low-resource settings. The aim was to understand the challenges faced by stakeholders during online learning and identify the features and system requirements needed to improve the learning experience in environments with limited resources.

The participants involved in the data collection process included learners, instructors, parents, and school administrators. These groups were selected because they are the main stakeholders involved in the use and management of e-learning systems. Learners provided information about their learning experiences, challenges, and preferred learning methods. Instructors shared their teaching challenges and desired teaching features, while parents and school administrators provided insights into supervision, monitoring, infrastructure, and system management needs.

Several requirement gathering techniques were used during Task 2. Surveys were the primary method used to collect data from participants because they made it possible to gather responses from different stakeholder groups efficiently. Brainstorming sessions were also carried out within the project team to identify possible system features and solutions. In addition, reverse engineering was used to study existing e-learning platforms and understand the features they provide as well as the limitations they have in low-resource settings.

After data collection, the responses obtained from the surveys were cleaned to improve accuracy before analysis. This ensured that the final dataset used for analysis was reliable and suitable for deriving system requirements and stakeholder needs.

Following the data cleaning process, charts and graphical representations were generated from the survey responses. These charts helped visualize participant responses and made it easier to identify patterns, trends, and major challenges affecting online learning in low-resource settings. The generated charts also supported the interpretation of the results and the extraction of both functional and non-functional system requirements for the proposed platform in task 3.

ANALYSIS OF SURVEY FINDINGS

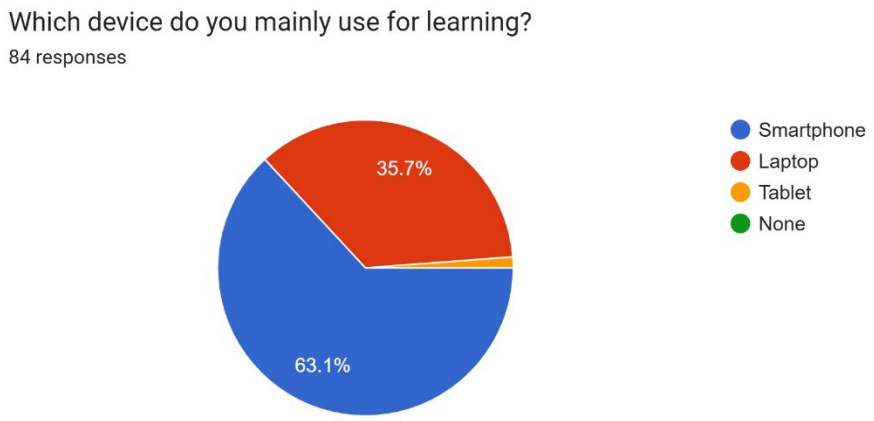
The charts presented below are some of the graphical representations generated from the survey responses collected during the requirement gathering phase of the project. These charts were used to visualize stakeholder opinions, identify common challenges experienced in online learning environments, and highlight the most important features expected from the proposed adaptive e-learning platform. The analysis of these findings helped in deriving both functional and non-functional requirements necessary for improving the quality of experience in low-resource settings.

Learners Mostly Use Smartphones

Finding:

The survey results showed that most learners use smartphones to access online learning platforms.

Chart:



Explanation:

This shows that mobile devices are the primary means through which learners access online education. Since smartphones are more accessible and affordable in low-resource settings, the system must prioritize mobile accessibility and usability.

Requirement:

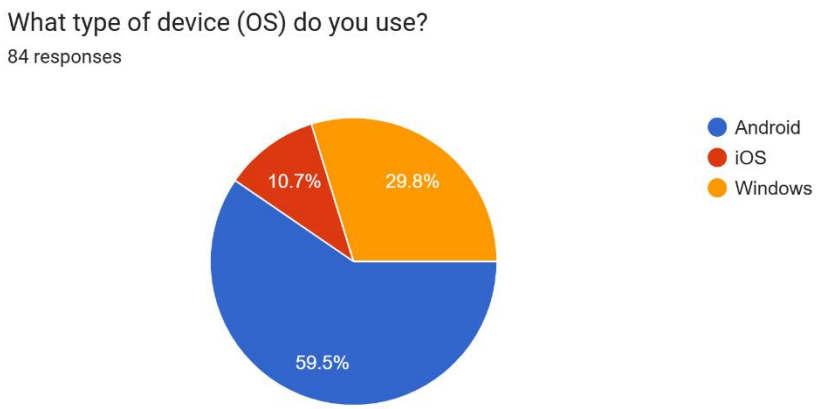
The system should provide a mobile-friendly and responsive interface optimized for smartphone usage.

Most Learners Use Android Devices

Finding:

Most respondents indicated that they use Android devices for online learning.

Chart:



Explanation:

Android devices are the most commonly available devices among learners in low-resource environments. This means the platform should function effectively on Android phones with different screen sizes and hardware capabilities.

Requirement:

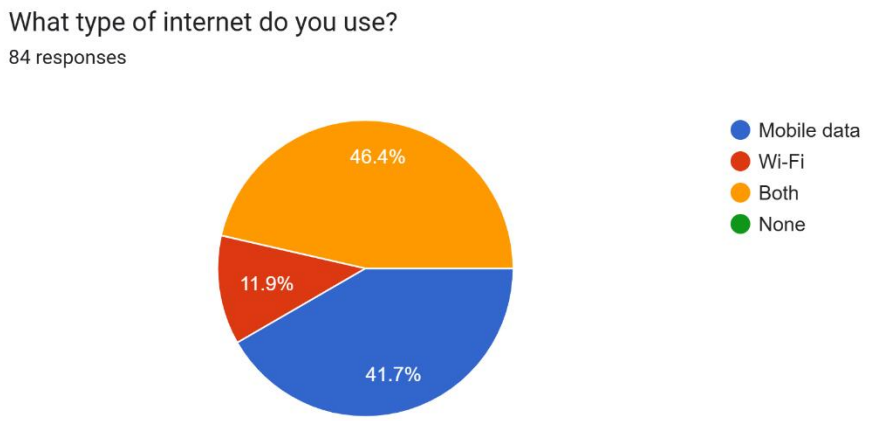
The system should be compatible with Android devices and support low-end smartphones.

Many Learners Depend on Mobile Data

Finding:

46.4% of learners use both Wi-Fi and mobile data, while 41.7% rely only on mobile data.

Chart:



Explanation:

This indicates that many learners depend heavily on mobile internet, which is often expensive and unstable. High data usage may discourage continuous participation in online learning activities.

Requirement:

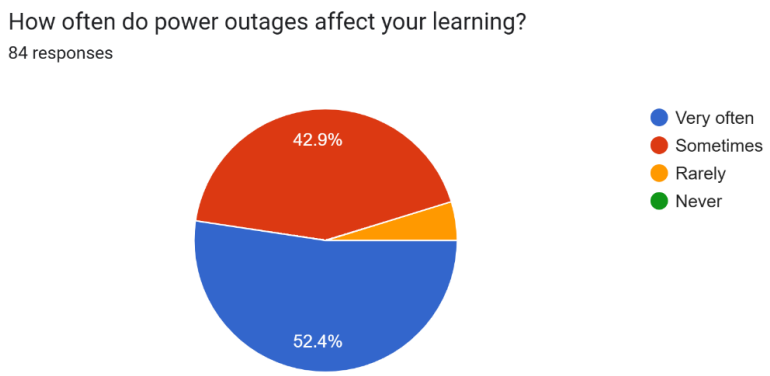
The system should optimize bandwidth and minimize data consumption during content delivery.

Power Outages Affect Learning

Finding:

Most learners reported that power outages negatively affect their online learning experience.

Chart:



Explanation:

Frequent power interruptions can disconnect learners during lessons and prevent continuous participation. This is a major challenge in low-resource settings where electricity supply may be unreliable.

Requirement:

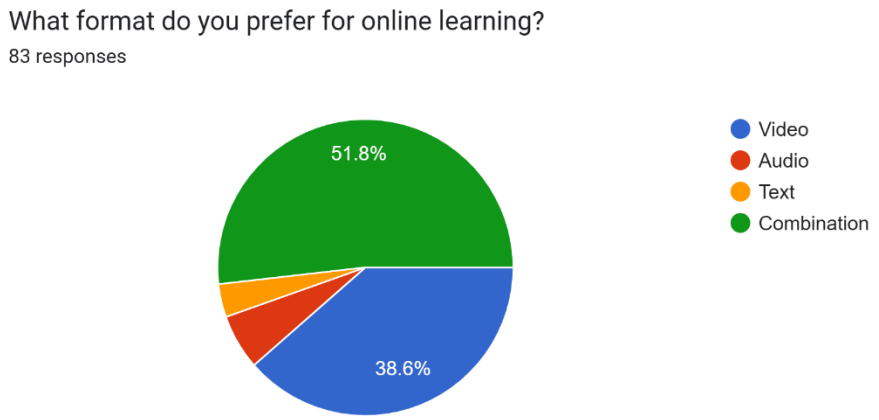
The system should support offline access and allow learners to continue from where they stopped after interruptions.

Learners Prefer Multimedia Learning Content

Finding:

51.8% of learners prefer a combination of video, audio, and text content during online learning.

Chart:



Explanation:

Different learners understand content better using different formats. Providing multiple content formats can improve engagement, understanding, and inclusiveness.

Requirement:

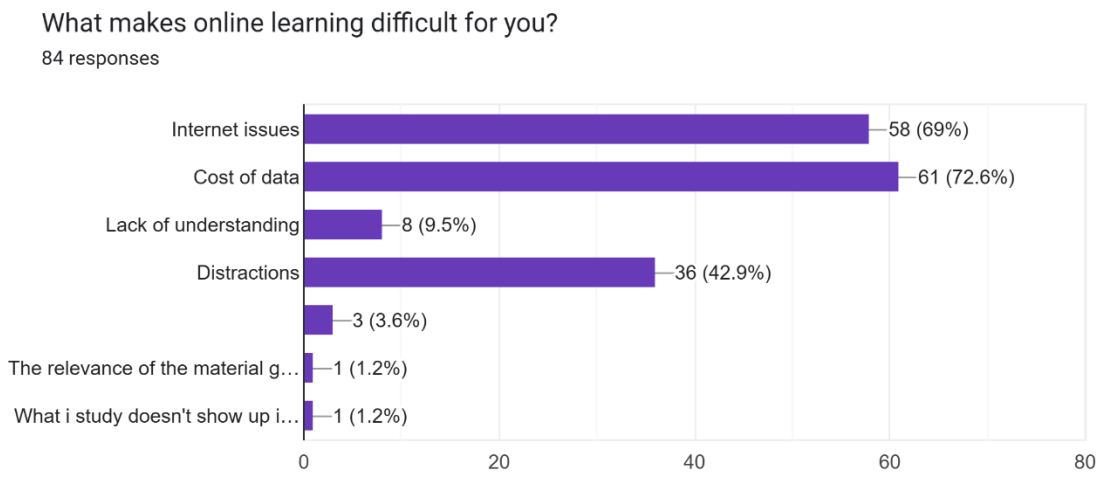
The system should support multimedia content including video, audio, and text-based materials.

Poor Network Quality and High Data Consumption Affect E-learning

Finding:

Most learners identified unstable internet and cost of data as major challenges in online learning.

Chart:



Explanation:

Poor connectivity reduces the quality of online lessons and may prevent learners from participating effectively. High data costs also limit access to educational content.

Requirement:

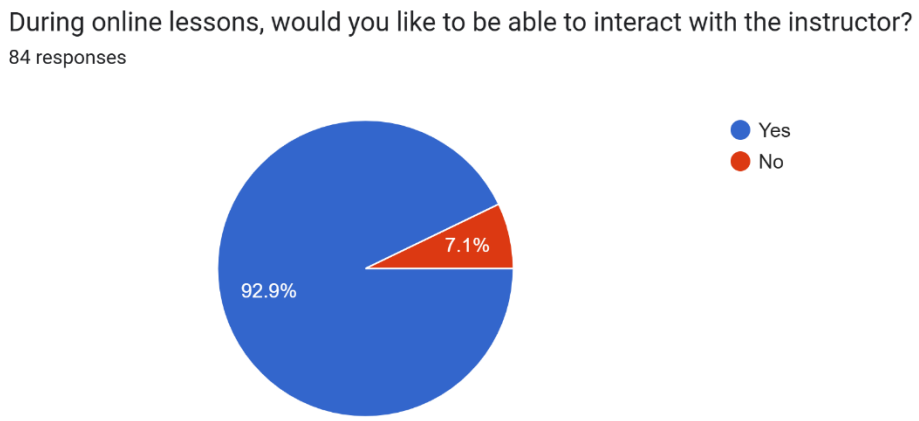
The system should function effectively under low-bandwidth conditions and provide adaptive content delivery.

Learners Want Interaction with Lecturers

Finding:

Most learners expressed interest in interacting with lecturers during online learning.

Chart:



Explanation:

Interaction improves learner engagement and helps students clarify difficult concepts during lessons.

Requirement:

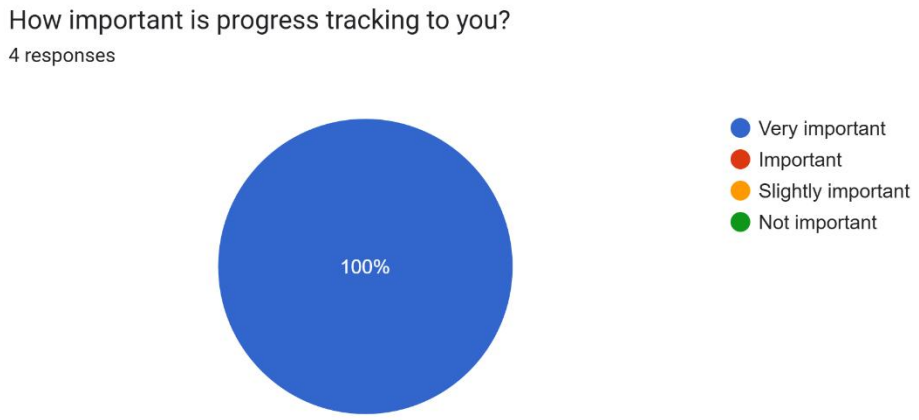
The system should provide live chat, discussion, and question-and-answer features.

Parents Want Progress Tracking

Finding:

Most parents indicated that they would like to track their children's learning progress.

Chart:



Explanation:

Parents want visibility into their children's participation and performance in online learning activities.

Requirement:

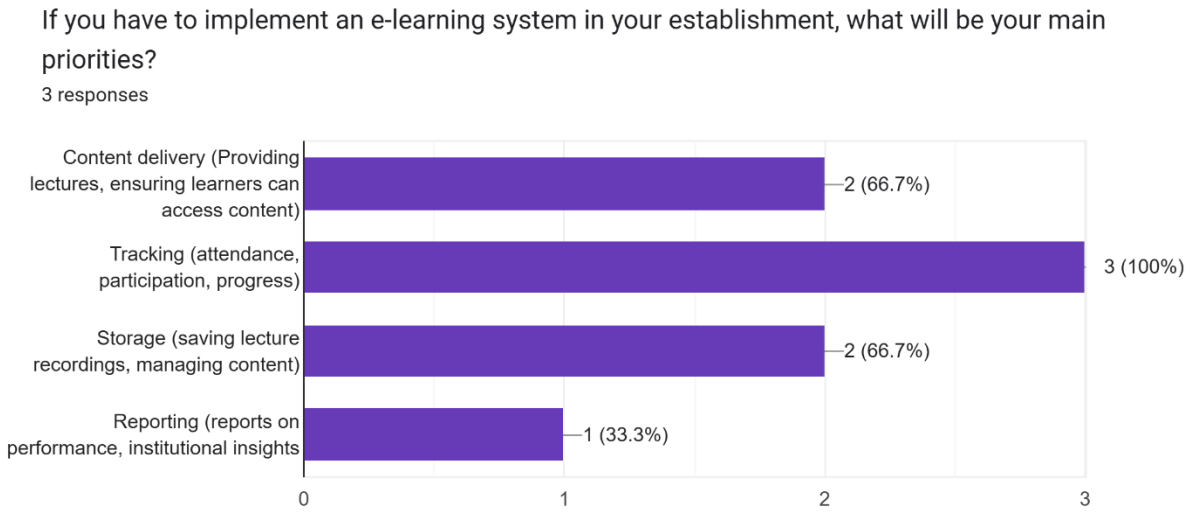
The system should provide learner progress tracking and monitoring features accessible to parents.

School Administrators Value Attendance and Progress Tracking

Finding:

Most school administrators considered attendance, participation, and progress tracking as the most important features.

Chart:



Explanation:

Administrators require monitoring tools to supervise academic activities and evaluate learner engagement.

Requirement:

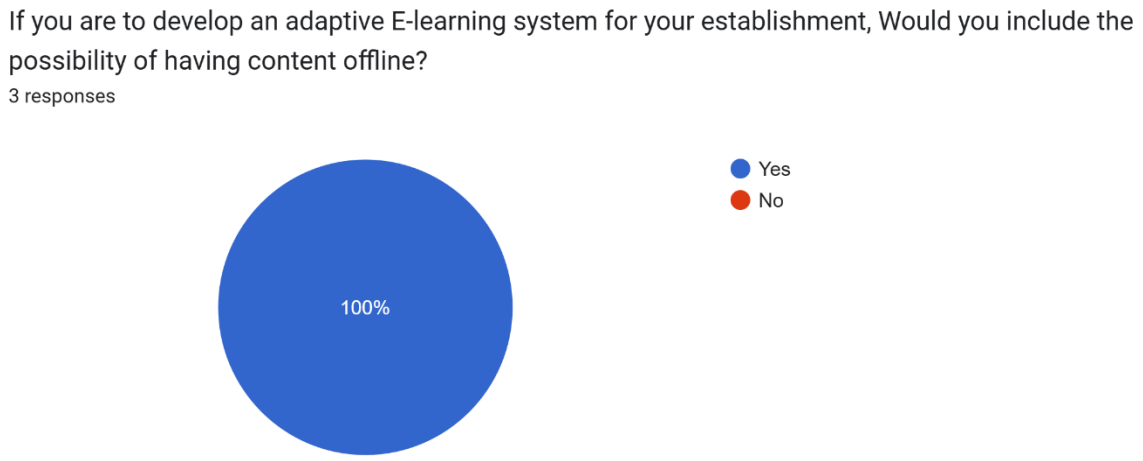
The system should provide attendance, participation, and progress tracking functionalities.

School Administrators Want Offline Content

Finding:

All school administrators indicated interest in offline content and recorded lessons.

Chart:



Explanation:

Offline learning support is important in environments with unstable internet connectivity.

Requirement:

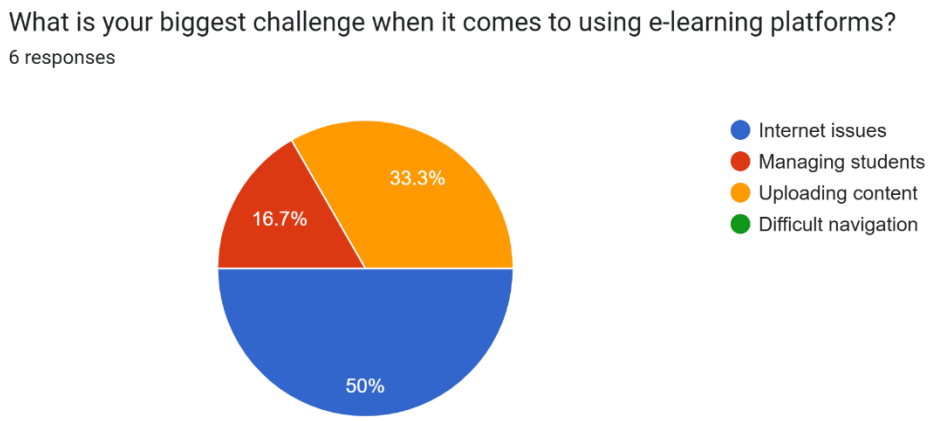
The system should support downloadable and offline-accessible learning materials.

Instructors Experience Network Challenges

Finding:

Most instructors identified poor network quality as their biggest challenge during online teaching.

Chart:



Explanation:

Unstable internet affects lesson delivery, communication, and learner participation during online classes.

Requirement:

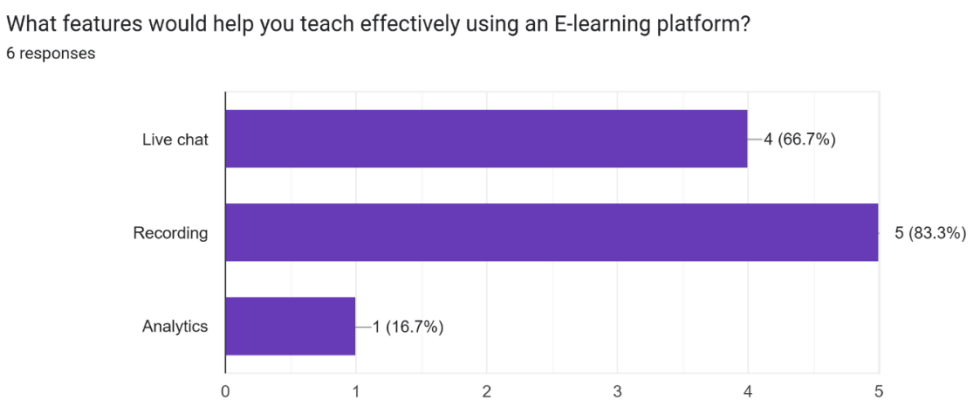
The system should maintain acceptable performance under poor network conditions.

Instructors Want Recording and Live Chat Features

Finding:

Most instructors indicated that lesson recording and live chat would help them teach more effectively.

Chart:



Explanation:

Recorded lessons allow learners to revisit content, while live chats improve communication and engagement during lessons.

Requirement:

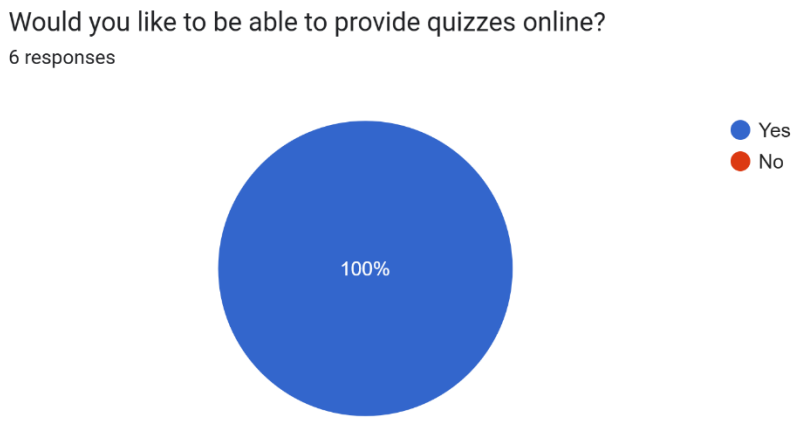
The system should provide lesson recording and real-time communication features.

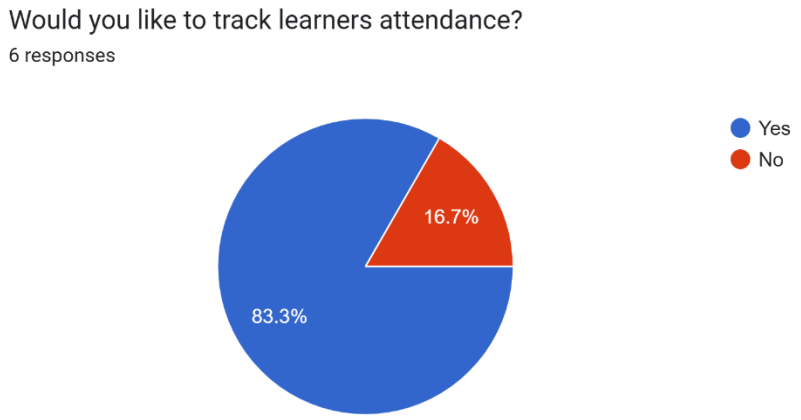
Instructors Want Online Quizzes and Attendance Tracking

Finding:

All instructors expressed interest in online quizzes, while most also wanted attendance tracking features.

Chart:





Explanation:

Assessment and attendance monitoring are important for evaluating learner participation and understanding.

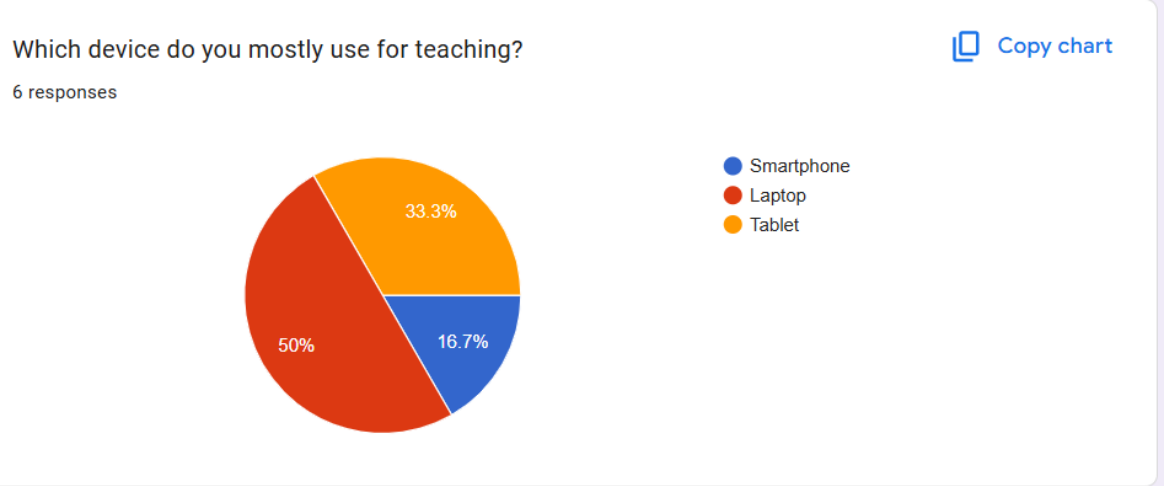
Requirement:

The system should support online quizzes, assessments, and attendance tracking.

Instructors use laptops for online teaching

Finding: Most instructors use laptops for online teaching.

Chart:



Explanation:

This shows that laptops are the primary means through which instructors provide online education. Since laptops make it easy for instructors to teach, manage students and upload course contents.

Requirement:

The system should provide a responsive interface optimized for laptop and desktop usage.

Below is a table showing all the findings, their explanations and the requirement from each finding.

Finding	Explanation of Finding	Requirement
Most learners use smartphones.	Learners mainly depend on smartphones for accessing online education platforms.	The system should provide a mobile-friendly and responsive interface.
Most learners use Android devices.	Android devices are the most accessible devices among learners in low-resource settings.	The system should support Android devices, including low-end smartphones.
Many learners depend on mobile data.	High data costs and unstable internet affect learner participation.	The system should minimize data consumption and optimize bandwidth usage.
Power outages affect learning.	Electricity interruptions disrupt online learning activities.	The system should support offline access and progress recovery after interruptions.
Learners prefer multimedia learning content.	Different learners understand content better using different formats.	The system should support video, audio, and text-based learning materials.
Poor network quality affects e-learning.	Unstable internet reduces the effectiveness of online learning.	The system should function effectively under low-bandwidth conditions.
Learners want interaction with lecturers.	Interaction improves engagement and understanding during lessons.	The system should provide live chat and discussion features.
Parents want progress tracking.	Parents want to monitor their children's learning activities and performance.	The system should provide learner progress tracking features.
School administrators value attendance and progress tracking.	Administrators require monitoring tools for academic supervision.	The system should support attendance, participation, and progress tracking.

School administrators want offline content.	Offline access is important in low-resource environments with unstable internet.	The system should support downloadable and offline-accessible content.
Instructors experience network challenges.	Poor internet quality affects lesson delivery and communication.	The system should maintain acceptable performance under poor network conditions.
Instructors want pre-recording, recording and live chat features.	These features improve communication and allow learners to revisit lessons.	The system should provide lesson recording and real-time communication features.
Instructors want quizzes and attendance tracking.	Assessment and attendance monitoring are important for evaluating learner participation.	The system should support quizzes, assessments, and attendance tracking.

REVIEW AND ANALYSIS OF REQUIREMENTS

Completeness Analysis

The requirements identified from the survey analysis show that the system adequately covers the needs of learners. The learners' requirements include mobile access, multimedia learning, offline support, progress tracking, interaction with instructors, and adaptive content delivery. These requirements ensure that learners in low-resource settings can access and continue learning despite challenges such as poor internet, power outages, and device limitations.

For instructors, the requirements are also well covered. The system supports teaching activities such as live sessions, lesson recording, quizzes, attendance tracking, and learner interaction. In addition, instructors' challenges with network instability are addressed through features like reconnection support and low-bandwidth optimization, ensuring smooth teaching even under poor connectivity conditions.

The requirements also sufficiently cover administrators. Administrators require monitoring and control features such as attendance tracking, progress reports, engagement analytics, and content management. The system also includes role-based access control, allowing administrators to manage instructors and learners effectively while maintaining oversight of system activities.

In terms of content delivery, the requirements are complete because they support multiple formats such as video, audio, text, slides, and downloadable recorded lessons. The system also supports offline access and adaptive content delivery, ensuring that learning materials are accessible even in environments with limited internet connectivity.

For network adaptation, the requirements clearly address the challenges of low-resource environments. The system is expected to minimize data usage, adapt content quality based on network strength, support reconnection after failure, and allow offline

access. These features ensure that the platform remains usable under unstable and slow internet conditions.

The requirements also address accessibility by ensuring the system is mobile-friendly, supports Android devices, works on shared devices, and provides an intuitive interface for users with different levels of digital literacy. This makes the system inclusive for learners, parents, and instructors in diverse environments.

Finally, regarding security, the requirements include role-based access control for learners, instructors, administrators, and parents. This ensures that users can only access features relevant to their roles. Additionally, login authentication and controlled access to academic data help protect user information and maintain system integrity.

Clarity Analysis

During the requirements analysis process, some of the initial requirements obtained from the survey were found to be vague or too general. To address this, each vague requirement was carefully reviewed and broken down into clear, specific, and actionable system requirements. This was done by interpreting the intent behind each response and converting it into measurable system functions.

For example, statements such as “learners want interaction with lecturers” were initially broad and unclear. This was clarified by defining specific features such as live chat, question-and-answer sessions, and discussion forums. This ensured that the requirement was not just descriptive but also implementable in the system design.

Similarly, the requirement “poor network affects learning” was too general to be directly implemented. It was clarified by translating it into specific system behaviors such as low-bandwidth optimization, adaptive content quality, and reconnection support during network failure. This made the requirement more precise and technically actionable.

Another example is the requirement “parents want to monitor their children’s learning.” This was clarified by specifying features such as progress tracking dashboards, activity reports, and performance summaries accessible to parents. This helped define exactly what “monitoring” means within the system.

In addition, “administrators want reports” was clarified by identifying the exact types of reports needed, such as attendance reports, performance reports, and engagement analytics. This removed ambiguity and ensured that reporting features could be properly designed and implemented.

Overall, vague requirements were clarified by analyzing the survey responses in context, identifying the actual user needs, and converting them into detailed functional and non-functional requirements that are specific, measurable, and implementable within the proposed system.

Technical Feasibility Analysis

From a technical perspective, the proposed adaptive e-learning platform is realistically achievable using currently available technologies. The core system can be developed using common and well-supported technologies such as React for the frontend, Node.js with Express for the backend, and MySQL for database management. These technologies are widely used, stable, and suitable for building scalable web-based learning systems.

The implementation of core e-learning features such as user authentication, role-based access control, content upload, quizzes, attendance tracking, and progress monitoring is fully feasible. These are standard functionalities in modern web applications and can be implemented using existing frameworks and libraries without requiring advanced or experimental technology.

Adaptive features based on network conditions are also technically possible, although they may require careful implementation. Techniques such as adaptive media streaming, image/video compression, lazy loading, and quality adjustment based on

bandwidth detection can be used to improve performance in low-network environments. These approaches are already used in existing platforms and can be integrated into the system.

Offline functionality is also realistic through the use of browser caching, service workers, and local storage mechanisms. These technologies allow users to download content and continue learning without continuous internet access, which is essential for low-resource settings.

However, some advanced features such as real-time synchronization under unstable networks, seamless reconnection during live sessions, and intelligent QoE-based adaptation may require additional effort and optimization. While they are possible, they may need careful design decisions to ensure stability and performance across different devices and network conditions.

Overall, the project is technically feasible because it relies on existing, proven technologies and does not require the development of entirely new systems. The main challenge is not whether it can be built, but how efficiently and effectively the adaptive features can be optimized for low-resource environments.

Dependency Relationships

In the proposed adaptive e-learning platform, several features depend on other core components in order to function correctly. Understanding these dependencies is important because it helps in structuring development in the right order and ensuring that foundational features are implemented before dependent ones.

The system is generally structured around core modules such as authentication, user management, content management, communication, assessment, tracking, and adaptation. Most advanced features rely on these foundational components.

Feature	Depends On	Explanation

User registration & login	User database, authentication module	Users must be authenticated before accessing any system feature.
Role-based access (learner, instructor, admin, parent)	Authentication system	The system must identify users before assigning permissions.
Course/content upload	Instructor accounts, content management module	Only authenticated instructors can upload learning materials.
Video/audio/text lessons	Content management system	Multimedia content relies on a structured content storage system.
Downloadable lessons	Content storage module, file management system	Files must be stored before they can be downloaded offline.
Live classes	Authentication, real-time communication module, network layer	Requires verified users and stable communication channels.
Live chat/Q&A	Communication module, user authentication	Users must be logged in to participate in discussions.
Quizzes and assessments	Content module, user authentication	Assessments must be linked to courses and valid users.
Attendance tracking	Live sessions or login tracking system	Depends on user participation in sessions or system logs.

Progress tracking	Assessments, attendance, content interaction data	Requires data from quizzes, attendance, and learning activity.
Lecturer rating system	User authentication, course participation data	Only users who participated can rate lecturers.
Offline learning mode	Content download system, storage/cache system	Requires downloaded content for offline access.
Adaptive content delivery (QoE-based)	Network monitoring module, content delivery system	Needs network data to adjust content quality dynamically.
Reconnection after network failure	Session management, network detection module	Requires tracking active sessions and detecting disconnections.
Reports (admin dashboards)	Attendance, progress tracking, assessment data	Generated from collected system activity data.
Parent monitoring dashboard	Progress tracking, authentication, role-based access	Parents can only view data after learner activity is recorded.

IDENTIFICATION OF ISSUES IN REQUIREMENTS

Inconsistencies

During the analysis of the collected requirements, some inconsistencies were identified between stakeholder preferences, expectations, and environmental limitations. These inconsistencies do not necessarily make the requirements invalid, but they reveal areas where design trade-offs and adaptive solutions are necessary.

One major inconsistency identified is that many learners prefer video-based learning and live explanations, yet they also reported that high data consumption and poor network quality are major challenges. Video content generally consumes large amounts of data and requires stable internet connectivity, which conflicts with the realities of low-resource settings.

Another inconsistency is that instructors and learners desire live interaction during lessons, while unstable internet and power outages frequently interrupt online sessions. This creates a conflict between the demand for real-time communication and the technical limitations experienced by users.

There is also an inconsistency between the desire for advanced features such as live classes, recorded lessons, quizzes, reporting, and adaptive learning, and the limited infrastructure available in many schools. Some administrators reported inadequate infrastructure as a major challenge, which may limit the implementation of resource-intensive features.

In addition, some learners use shared devices while still expecting continuous and flexible access to learning materials. Shared device usage may reduce availability and continuity of learning, especially when multiple users depend on the same device.

The identified inconsistencies were addressed by proposing adaptive and flexible system features such as offline access, downloadable content, low-bandwidth

optimization, and multimedia alternatives including audio and text-based learning materials.

Identified Inconsistency	**Explanation**	**Possible Solution**
Learners prefer video content but complain about high data consumption.	Video lessons require significant bandwidth and data usage.	Provide adaptive video quality, audio-only mode, and downloadable notes.
Users want live interaction despite unstable internet connectivity.	Live sessions depend on stable internet, which is limited in low-resource settings.	Provide recorded lessons, reconnection support, and live chat alternatives.
Schools want advanced features but lack sufficient infrastructure.	Some institutions may not have enough technical resources to support complex systems.	Use lightweight technologies and cloud-based deployment solutions.
Learners expect continuous access while some use shared devices.	Shared devices may limit learner access time and availability.	Support cross-device login and offline content access.
Instructors want live teaching while power outages remain common.	Power interruptions can disrupt online teaching sessions.	Allow lesson recording, automatic progress saving, and session recovery.

Ambiguities

During requirement analysis, some of the survey responses and initially gathered requirements were found to be ambiguous, meaning they were too general or unclear to be directly implemented in the system design. These ambiguities were resolved by interpreting the intended meaning and converting them into clear, specific, and actionable system requirements.

Below are examples of ambiguous statements and how they were clarified for system development:

Ambiguous Statement	**Clarification**	**Explanation**
“Learners want interaction with lecturers”	The system should provide live chat, Q&A sessions, and discussion forums.	Interaction can mean different things, so it was broken down into specific communication features.
“Poor network affects learning”	The system should support low-bandwidth mode, adaptive video quality, and reconnection after failure.	This statement does not specify how the system should respond to poor network conditions.
“Parents want to monitor their children”	The system should provide dashboards showing attendance, progress, and performance reports.	Monitoring was clarified into measurable tracking features.
“System should be easy to use”	The system should have a simple user interface, minimal navigation steps,	Ease of use is subjective, so it was translated into usability design principles.

	and clear layout for all user roles.	
“Instructors want to track students”	The system should track attendance, quiz results, participation, and learning progress.	Tracking was clarified into specific measurable indicators.
“System should work well in low-resource settings”	The system should optimize data usage, support offline access, and function under slow internet conditions.	Low-resource settings was broken down into technical constraints like bandwidth and power issues.
“Students should learn effectively”	The system should provide multimedia content, quizzes, feedback, and adaptive learning based on user performance.	Effectiveness was translated into measurable learning support features.

Missing information

During the requirements analysis phase, several important gaps were identified in the collected requirements. These gaps mainly relate to missing details that are necessary for proper system design and implementation. To address these issues, clarifications and additional design assumptions were made to ensure that the system requirements are complete, realistic, and implementable.

One major issue is that some requirements did not clearly define how features should work technically. For example, stakeholders requested “offline learning” but did not specify how content should be stored or updated. To solve this, the requirement was refined to include offline caching, downloadable content, and synchronization when the internet is restored.

Another missing aspect is the lack of detail on how network adaptation should be implemented. Users requested better performance in low internet conditions, but did not specify whether this should involve video compression, quality switching, or text-based fallback modes. This was clarified by defining adaptive content delivery based on bandwidth detection and automatic quality adjustment.

There was also missing information regarding user roles and permissions. While learners, instructors, parents, and administrators were identified, the exact access levels and restrictions were not clearly defined. This was resolved by introducing role-based access control, where each user type has specific permissions within the system.

In addition, requirements related to assessment and tracking lacked detail on how data should be collected and processed. For example, “track attendance and progress” did not specify whether tracking should be manual, automatic, or based on login activity. This was clarified by defining automatic tracking through system activity logs, quiz results, and session participation.

Finally, there was insufficient detail on system performance and scalability expectations. Users emphasized the need for a system that works in low-resource settings, but did not define acceptable performance levels such as loading time, data usage limits, or maximum concurrent users. These were addressed by introducing performance constraints such as low bandwidth optimization, fast loading interfaces, and lightweight content delivery.

Missing Information	**Explanation of Issue**	**Solution / Clarification**
Offline learning mechanism	Users requested offline access but did not specify	Define downloadable content with caching and

	how content should be accessed or updated.	synchronization when internet is available.
Network adaptation method	No details on how the system should adjust to poor internet conditions.	Introduce adaptive streaming, compression, and low-data modes.
User roles and permissions	Roles were identified but access levels were not clearly defined.	Implement role-based access control for learners, instructors, parents, and admins.
Attendance and progress tracking method	No specification on how tracking should be done (manual or automatic).	Use automatic tracking via login sessions, quiz results, and activity logs.
System performance expectations	No clear benchmarks for speed, data usage, or scalability.	Define low-bandwidth optimization, fast loading time, and lightweight design principles.

PRIORITIZATION OF REQUIREMENTS

This section presents requirements prioritized based on importance to users, technical feasibility, and project scope constraints. The aim is to ensure a realistic implementation within a limited time frame while still covering all core functionalities of an adaptive e-learning system for low-resource settings.

Requirement	**Importance**	**Feasibility**	**Priority**
User authentication and role-based access (Learner, Instructor, Admin, Parent)	High	High	Must-have
Mobile-friendly and responsive interface	High	High	Must-have
Course/content upload and management	High	High	Must-have
Recorded lessons (video/audio/text materials)	High	Medium	Must-have
Online quizzes and assessments	High	High	Must-have
Attendance and progress tracking system	High	Medium	Must-have
Offline downloadable learning materials	High	Medium	Must-have
Low-bandwidth optimization (data saving mode)	High	Medium	Must-have
Live video classes (basic implementation)	High	Low	Should-have (simplified)
Live chat / Q&A during lessons	Medium	Medium	Should-have
Lecturer rating and feedback system	Medium	High	Should-have
Parent monitoring dashboard	Medium	Medium	Should-have
Advanced QoE-based adaptive streaming (auto quality switching)	High	Low	Nice-to-have
Real-time reconnection during live sessions	Medium	Low	Nice-to-have

The system focuses first on core learning functionality such as authentication, content delivery, quizzes, and tracking. Features that are critical for low-resource environments (offline mode, low data usage) are treated as Must-have requirements.
Live video classes are included but treated as a simplified implementation due to time and technical constraints. Advanced adaptive QoE features are classified as Nice-to-have because they are complex and may exceed the implementation window.

CLASSIFICATION OF REQUIREMENTS

Here, we classified the identified system requirements into functional and non-functional requirements based on their nature and role in the system. Functional requirements describe what the system should do, while non-functional requirements describe how the system should perform.

Functional Requirements

These are the requirements that define what the system should do in terms of features and services.

- The system should allow users to register, log in, and access the platform based on their roles (learner, instructor, parent, administrator).
- The system should provide role-based access control for different user categories.
- The system should allow instructors to upload and manage learning content.
- The system should provide learners with access to video, audio, text, and slide-based learning materials.
- The system should support recorded lessons that learners can access at any time.
- The system should provide online quizzes and assessments for learners.
- The system should track learner attendance during sessions or system usage.
- The system should track instructor attendance.
- The system should track learner progress based on activities and assessments.
- The system should allow live classes for real-time teaching and learning.
- The system should provide live chat and question-and-answer features during lessons.
- The system should allow learners to rate and give feedback on instructors.
- The system should provide parents with access to monitor learner progress.
- The system should generate reports for administrators on attendance, performance, and engagement.

Non-functional Requirements

- The system should be mobile-friendly and optimized for smartphone usage.
- The system should be compatible with Android devices, including low-end smartphones.
- The system should be optimized for low-bandwidth environments and unstable internet connections.
- The system should minimize data consumption during content delivery.
- The system should support offline access through downloadable learning materials.
- The system should ensure system reliability and availability in low-resource settings.
- The system should provide fast loading times (< 5 seconds) and responsive user interaction.
- The system should ensure usability for users with low digital literacy.
- The system should support adaptive content delivery based on network conditions.
- The system should ensure data security and restrict access based on user roles.

SOFTWARE REQUIREMENTS SPECIFICATION

INTRODUCTION

Purpose

The purpose of this Software Requirement Specification (SRS) is to define the functional and non-functional requirements of an adaptive e-learning platform based on Quality of Experience (QoE) for inclusive online education in low-resource settings. This document provides a clear description of what the system is expected to do and the constraints under which it will operate.

Scope

This system is designed to support online learning for learners, instructors, parents, and school administrators in environments with limited resources such as unstable internet, power outages, and limited access to digital devices. The platform will provide learning content delivery, interaction tools, assessments, progress tracking, and adaptive features to improve user experience.

Objectives

The main objectives of the system are to improve accessibility to education, enhance learner engagement, support instructors in delivering content effectively, and enable administrators and parents to monitor learning activities. The system also aims to optimize learning under low-resource conditions through adaptive content delivery and offline capabilities.

System Overview

Description of the Platform

The proposed system is a web-based adaptive e-learning platform that delivers educational content in multiple formats such as video, audio, and text. It is designed to adjust to network conditions and provide offline learning capabilities to ensure continuity in low-resource environments.

Stakeholders

The main stakeholders of the system include:

- Learners
- Instructors
- Parents
- School administrators

Major Features

The system will include features such as user authentication, role-based access, course content management, live and recorded lessons, quizzes and assessments, attendance tracking, progress monitoring, communication tools, and adaptive content delivery based on network conditions.

Functional Requirements

- The system should allow users to register, log in, and access the platform based on assigned roles.
- The system should implement role-based access control for learners, instructors, parents, and administrators.
- The system should allow instructors to upload and manage learning content.
- The system should provide learners with access to video, audio, text, and slide-based learning materials.
- The system should support recorded lessons that can be accessed offline or online.
- The system should provide online quizzes and assessments for learners.
- The system should track learner attendance and participation in learning activities.
- The system should track instructor attendance.
- The system should monitor learner progress based on activities and assessments.
- The system should support live classes for real-time teaching and learning.
- The system should provide live chat and question-and-answer functionality during lessons.

- The system should allow learners to rate and give feedback on instructors.
- The system should provide parents with access to learner progress information.
- The system should generate reports for administrators on attendance, performance, and engagement.

Non-Functional Requirements

- The system should be mobile-friendly and optimized for smartphones.
- The system should be compatible with Android devices, including low-end devices.
- The system should operate efficiently under low-bandwidth and unstable network conditions.
- The system should minimize data consumption during content delivery.
- The system should support offline access to learning materials.
- The system should ensure high system reliability and availability.
- The system should provide fast response time and smooth user interaction.
- The system should be easy to use for users with different levels of digital literacy.
- The system should ensure data security through authentication and role-based access control.
- The system should support scalability for multiple users accessing the platform simultaneously.

Constraints

1. Network Constraints.
    - The system must operate effectively under low bandwidth and unstable internet conditions common in low-resource environments.
    - The system must support intermittent connectivity including partial offline functionality
    - Real-time adaptation must work even with fluctuating network speeds.
2. Device Constraints
    - The system must be optimized for low-end Android smartphones.
    - The system must also support laptops used by instructors

- The interface must be responsive and lightweight, minimizing memory and processing usage.

3. Performance Constraints.
    - The system must ensure fast loading times, even on slow networks.
    - Multimedia content must be compressed and optimized to reduce data usage.
    - Real-time adaptation based on network conditions must not introduce significant delays.
4. Usability Constraints
    - The platform must be usable by individuals with varying levels of digital literacy.
    - The user interface must be simple, intuitive, and mobile-friendly.
5. Content Constraints
    - The system must support multiple content formats while ensuring they are suitable for low-resource environments.
    - Uploaded content must be optimized or compressed automatically or manually before delivery.
6. Technological Constraints.
    - The system must be built as a Progressive Web App (PWA). Because learners primarily use smartphones with limited storage space and instructors use laptops, a PWA provides a single adaptable codebase. Furthermore, it bypasses large app store downloads to save device memory and utilizes browser caching to support the required offline access during power outages.
    - The system must utilize React for the frontend user interface. React's lightweight, Virtual DOM architecture is essential to minimize memory and processing usage, ensuring the application remains fast and responsive on the low-end Android smartphones predominantly used by learners.
    - The system must use Express.js running on the Node.js runtime environment. This asynchronous, event-driven architecture is required to

efficiently handle the system's real-time features, such as live chat and question-and-answer interactions, without failing under low-bandwidth network conditions.

- The system must use PostgreSQL (and SQL). Structured relational data management is necessary to securely implement the required role-based access control (Learners, Instructors, Parents, Admins) and accurately track learner attendance and academic progress.

Assumptions

1. User Assumptions
    - Users have basic digital literacy, including the ability to navigate web platforms and mobile apps.
    - Users will interact with the platform individually. That is, no shared accounts.
2. Device Assumptions
    - Learners will access the system using smartphones
    - Instructors will primarily use laptops.
    - User devices support modern web browsers capable of rendering multimedia content.
3. Connectivity Assumptions
    - Users will have at least occasional internet access, even if it is unstable.
    - Network speed may vary, but it will be sufficient at times to allow content synchronization and updates.
4. Content Assumptions
    - Instructors will upload relevant and structured learning materials.
    - Instructors will follow recommended formats to ensure compatibility and optimization.
5. System Usage Assumptions
    - Users will engage with the platform regularly enough for the system to adapt content delivery effectively.

- Real-time adaptation based on network conditions will improve user experience (QoE).

REQUIREMENT VALIDATION

Requirement validation was carried out to ensure that the identified requirements accurately reflected the needs of the stakeholders and aligned with the objectives of the proposed adaptive e-learning platform. The validation process helped confirm that the requirements were understandable, realistic, relevant, and suitable for low-resource educational environments.

To validate the requirements, a summarized list of the identified functional and non-functional requirements was presented to selected stakeholders, including learners, instructors, and school administrators. The stakeholders reviewed the requirements and provided feedback on whether the proposed features addressed their challenges and expectations regarding online learning in low-resource settings.

During the validation process, stakeholders confirmed the importance of features such as offline learning support, recorded lessons, low-bandwidth optimization, quizzes, attendance tracking, and interaction tools. Additional clarifications were also obtained for some

requirements that were initially too broad or unclear. This helped improve the quality and accuracy of the final requirements specification.

The requirements were verified by checking whether each requirement was consistent with the survey findings and project objectives. Requirements were also reviewed to ensure that they were clear, feasible, and implementable within the scope of the project. Duplicate and conflicting requirements were removed, while vague requirements were refined into more specific and measurable statements.

Overall, the validation and verification process helped ensure that the final requirements accurately represented stakeholder needs and provided a solid foundation for the design and implementation of the adaptive e-learning platform.

CONCLUSION

In this task, we successfully reviewed, analyzed, prioritized, and validated the system requirements for the proposed Quality of Experience (QoE) driven adaptive e-learning platform. By evaluating survey feedback from learners, instructors, parents, and school administrators, we identified the critical barriers affecting online education in low-resource settings—namely poor network quality, high data consumption, frequent power outages, and limited device capabilities.

To directly address these challenges, stakeholders prioritized essential system features, including offline learning support, adaptive content delivery, recorded and live lessons, attendance tracking, and seamless instructor-learner interaction. These findings established a clear baseline for both our functional and non-functional requirements.

Technologically, we concluded that a Progressive Web App (PWA) is the optimal architecture for this system. Unlike native or hybrid applications, a PWA provides a single, highly adaptable codebase that serves both mobile users (predominantly on Android smartphones) and instructors on laptops. Crucially, it bypasses heavy app store downloads to conserve limited device storage and leverages browser caching to guarantee access to learning materials during network or power failures. This architecture will be powered by a lightweight React frontend, a responsive Node.js and Express backend, and a secure PostgreSQL database for comprehensive data management.

Overall, the requirement analysis conducted in this task successfully translated stakeholder needs into clear, actionable technical specifications. These validated requirements and defined technological constraints now establish a strong, feasible foundation for the upcoming design and implementation phases of the platform.
